RESEARCH PROFILE

I measure molecular composition in intact samples and check that the result holds on data the model has not seen. The unit has been a cell or a tissue region. My hands–on measurement experience is multiplexed protein and RNA detection in situ, single–cell and spatial profiling, high–parameter flow cytometry and binding analysis, and I write the analysis code that reads them, down to a custom caller when the standard tools cannot resolve something. At PB Immune Therapeutics I built the in–house single–cell, spatial and proteomic analysis capability and ran the therapeutic programs it fed. My current work is deep–learning multimodal integration of imaging, transcriptomic and clinical data.

POSITION–RELEVANT EXPERTISE

- **Cell–state calling from incomplete data.** Cell states resolved under ambiguity from single–cell and spatial data: **consensus NMF** gene programs, isoform and transcript resolution from short reads, embedding representations, and confidence reported per call rather than assumed.
- **Multi–modal integration of molecular identity.** Transcriptome for identity, chromatin and T–cell receptor repertoire for state and clonality, spatial data for location, and plasma proteome for the soluble compartment, brought into one cell–state–resolved model.
- **Multiplexed in situ and spatial measurement.** **GeoMx DSP** run end to end, **Visium**, **MACSima** cyclic multiplexed immunofluorescence, **Olink** targeted proteomics, fluorescence panels up to 24 markers, and **Biacore SPR** with ELISA for binding kinetics and affinity.
- **Study design a model can learn from.** Donor pooling with SNP demultiplexing so donor and run stay separable; multi–site QC across more than 700 donors, 8 organs and 23 immune diseases; automated library preparation on the **10x Chromium Connect**; held–out evaluation in reproducible Python and R pipelines.
- **Program execution and grant writing.** A humanized anti–CD40 program led from candidate ranking to non–human–primate studies and a registered patent in 2024. About \$1.3 million across five industry proposals, lead writer on four, always under the institutional PI and not as PI. K99/R00 and LSRF are open to me, and I would apply within the first two years.

A cell state defined, then tested for cause. Four matched cohorts of 16 donors, pooled four per lane and demultiplexed by SNP so donor and sequencing run were not confounded. 251,055 memory CD4⁺ T cells; consensus NMF gave 12 reproducible programs from k = 14; custom UMI-aware, BAM-level code resolved PDE4D isoform identity from 5' reads, which a count matrix cannot separate. The state recurs across 702 samples in the SCAID atlas, held-out AUC 0.780 for arthritis. Short-isoform overexpression raised the pathogenic fraction and a selective inhibitor lowered it.

Tissue to single-cell readout, built end to end. Whole-brain harvest, enzymatic digestion, Percoll enrichment, CD45⁺ FACS, 10x library generation, then the analysis. 11,587 cells and ten immune populations in a 5x FAD mouse model; exhausted CD8⁺ tissue-resident memory T cells engaging choroid-plexus epithelium at the blood-CSF barrier, with MHC class I, interferon-stimulated genes and JAK-STAT raised on that epithelium.
